The Bayes Factor for Case-Control Studies with Misclassified Data

Tzesan Lee
Centers for Disease Control & Prevention
Atlanta, GA

The question of how to test if collected data for a case-control study are misclassified was investigated. A mixed approach was employed to calculate the Bayes factor to assess the validity of the null hypothesis of no-misclassification. A real-world data set on the association between lung cancer and smoking status was used as an example to illustrate the proposed method.

Keywords: Bayes factor, Misclassification, p-value.

Introduction

Misclassification is a ubiquitous problem in epidemiologic studies. Particularly, it often occurs if the data are obtained from the proxy or surrogate (Nelson, Longstreth, Koesell, and van Belle 1990). Methods for dealing with misclassified data from case-control studies have been widely studied. See, for example, Kleinbaum, Kupper & Morgenstern (1982), Fleiss, Levin & Paik (2003), and Rothman, Greenland & Lash (2008). Almost all studies make an assumption in the beginning that the collected data are misclassified. Yet how to test the validity of this assumption has not been addressed.

These issues can also be considered from a Bayesian perspective. First, the misclassification probabilities are included in both the null and alternative hypothesis. Second, bias-adjusted estimators for the proportion of exposure in cases or controls are presented. Third, the uniform and the Beta distributions are adopted respectively as the prior distribution for the misclassification probability and population proportion parameter in cases or controls. Finally, the lower-bound for the Bayes factor is calculated. A real-world data set was used as an example to illustrate the proposed method. A comparison between the p-value and the Bayes factor is made.

Methodology

Consider the data for case-control studies given in Table 1. The random variable \( E^* \) denotes the classified surrogate for the true exposure variable \( E \), while the variable \( D \) indicates the disease status of the subjects with \( D = 1 \) and \( D = 0 \) representing cases and controls respectively. Suppose that \( E^* \) is misclassified, but \( D \) is not misclassified.

Table 1. Case-control studies with misclassified data

<table>

<td>( n_{00} )</td>
</tr>
<tr>
<td>Sample size</td>
<td></td>
<td>( n_{[1]} )</td>
<td>( n_{[0]} )</td>
</tr>
</tbody>
</table>

It is well known that the traditional sample proportion estimator of the exposed group given by

\[
\hat{p}_i = \frac{n_i}{n_{[i]}} \quad \hat{q}_i = 1 - \hat{p}_i
\]

In terms of the sensitivity and specificity defined by

\[
\phi_i = \Pr\left( E^* = 1 \mid E = 1, D = i \right), \quad \bar{\phi}_i = 1 - \phi_i
\]

\[
\psi_i = \Pr\left( E^* = 1 \mid E = 0, D = i \right), \quad \bar{\psi}_i = 1 - \psi_i
\]

it was shown (Lee, 2009) that

\[
E\left( \hat{p}_i \right) = \phi_i p_i + \left( 1 - \psi_i \right) q_i = p_i \cdot \Delta_i + 1 - \psi_i
\]

\[
E\left( \hat{q}_i \right) = \left( 1 - \phi_i \right) p_i + \psi_i q_i = q_i \cdot \Delta_i + 1 - \phi_i
\]
From Equations 4 and 5 it is seen that the traditional sample proportion estimators, $\hat{p}_i$ and $\hat{q}_i$, are no longer unbiased. By solving Equations 4 and 5 with the left-side $E(\hat{p}_i)$ or $E(\hat{q}_i)$ being replaced by $\hat{p}_i$ or $\hat{q}_i$, it follows

$$\bar{p}_i = (\psi_i - \hat{q}_i)/\Delta_i, \quad (6)$$

$$\bar{q}_i = (\varphi_i - \hat{p}_i)/\Delta_i, \quad (7)$$

where

$$\Delta_i = \varphi_i + \psi_i - 1, \quad i = 0, 1. \quad (8)$$

Equations 6 and 7 are called the bias-adjusted proportion (BAP) estimators of $p_i$ and $q_i$. The BAP estimators are said to be admissible if they are greater than zero but less than one plus their sum equals to one. Evidently, the following constraints are required to be imposed on the sensitivity and specificity in order for Equations 6 and 7 to be admissible (Lee, 2009):

$$\varphi_i > \hat{p}_i,$$

$$\psi_i > \hat{q}_i,$$

$$\varphi_i + \psi_i > 1. \quad (9)$$

A concern is aimed at testing whether the given data in Table 1 are misclassified - whether the exposure rates for cases and control are the same. This can be tested through the hypothesis testing which is formulated as follows:

$$H_0 : \epsilon_{RD} = 0 \quad \text{versus} \quad H_1 : \epsilon_{RD} \neq 0, \quad (10)$$

where $\epsilon_{RD} = p_1 - p_0$, the subscript “$RD$” means the rate difference. However, Equation 10 can’t be used to test whether the observed data of Table 1 are misclassified. In order to test if the data are misclassified, the hypotheses of Equation 10 has to be enlarged by including the misclassification probabilities associated with both cases and controls given as follows:

$$H_0 : \epsilon_{RD} = 0, \overline{\varphi}_i = \overline{\psi}_i = 0 \quad \text{versus} \quad H_1 : \epsilon_{RD} \neq 0, \overline{\varphi}_i \neq 0, \overline{\psi}_i \neq 0, \quad i = 0, 1, \quad (11)$$
BAYES FACTOR FOR CASE-CONTROL STUDIES MISCLASSIFIED DATA

To test the hypotheses of Equation 11, a mixed Bayesian approach is taken to tackle this problem (Kass & Raftery, 1995).

Let

\[ \tilde{\epsilon}_{RD} = \tilde{p}_1 - \tilde{p}_0 - \epsilon_{RD} \]  

(12)

It can be shown

\[ E(\tilde{\epsilon}_{RD}) = 0, \]  

(13)

\[ \text{Var}(\tilde{\epsilon}_{RD}) = \text{Var}(\tilde{p}_1) + \text{Var}(\tilde{p}_0 + \epsilon_{RD}) = \sum_{i=0}^{1} (p_i \cdot \Delta_i + 1 - \psi_i)(q_i \cdot \Delta_i + 1 - \phi_i) \cdot n^{-1}_{[i]} \]  

(14)

Define

\[ \bar{x}_{RD} = \frac{\tilde{\epsilon}_{RD}^2}{\text{Var}(\tilde{\epsilon}_{RD})} \]  

(15)

To assess the evidence in favor of supporting the null against the alternative hypothesis of Equation 11, the Bayes factor for favoring \( H_0 \) relative \( H_1 \) from using Equation 15 can be calculated as follows:

\[ B^x(\bar{x}_{RD}) = \frac{f(\bar{x}_{RD} | H_0)}{m_g(\bar{x}_{RD})} \]  

(16)

where

\[ m_g(\bar{x}_{RD}) = \int_{\Omega} \int f(\bar{x}_{RD} | H_1) \prod_{i=0}^{1} h_0(\phi_i, \psi_i) g(p_i, q_i) d\phi_i d\psi_i dp_i dq_i \]  

(17)

\( f(\bar{x}_{RD} | H_1) \) is the central chi-square distribution with one degree of freedom, \( g(p, q) = \Gamma(\eta + \tau) p^{\eta-1} q^{\tau-1} / \left[ \Gamma(\eta) \Gamma(\tau) \right] \), the beta distribution with the parameters \( \eta \) and \( \tau \) over \([0, 1]\), and \( h_0(\phi_i, \psi_i) = [\phi_i \psi_i]^{-1} \) is the uniform distribution.
over $\Omega_i = [a_i,1] \times [b_i,1]$, where $a_i$ and $b_i$ are specified in the Appendix. Although the posterior marginal probability density function of $m_g$ (Equation 17) depends on two hyper-parameters $\eta$ and $\tau$, a Bayes/non-Bayes compromise rather than a type III hyper-distribution for $\eta$ and $\tau$ is adopted to estimate $\eta$ and $\tau$ (Good & Crook, 1974). As a result, the parameters $\eta$ and $\tau$ are estimated by employing the likelihood method. The maximum likelihood estimators for $\eta$ and $\tau$ and the relative maximum value of $m_g$ of Equation 17 are denoted respectively by $(\eta_{\text{max}}, \tau_{\text{max}})$ and $m_{g_{\text{max}}} = m_g(\eta_{\text{max}}, \tau_{\text{max}})$. Thus, define the lower bound of the Bayes factor (Equation 16) as follows:

$$B^* = f(\bar{x}_{R31|H_0}) / m_{g_{\text{max}}}$$

The details of calculating Equation 18 are given in the Appendix.

**Example**

Although there is some evidence of a greater than average risk in some occupations to have the lung cancer, these occupations could not account for the general increase in pulmonary cancer. It is thought of interest to select a particular population group, homogeneous economically, with little occupational exposure to respiratory irritants and with equal access to diagnostic facilities. Physicians are believed to represent such a group. Wynder and Cornfield (1953) reported a study on the exposure to tobacco and other possible respiratory irritants of 63 physicians with lung cancer and 133 physicians with cancers in areas where respiratory irritants are not believed to play a part. Among these 133 physicians, 43 cases were cancer of stomach and kidney, 45 cases cancer of colon and lymphoma, and 45 cases cancer of bladder, leukemia and sarcoma. The data in Table 2 is taken from Cornfield (1956) who only used 43 cases from cancer of stomach and kidney as a control group. The non-smoker is defined to be those who smoked the equivalent of less than 1 cigarette a day. Here it is of interest to test whether the data concerning the smoking status in Table 2 for both cases and controls are misclassified.
BAYES FACTOR FOR CASE-CONTROL STUDIES MISCLASSIFIED DATA

Table 2. The data of physicians with and without lung cancer by smoking status

<table>
<thead>
<tr>
<th>Smoking status</th>

<tr>
<td>Total</td>
<td>63</td>
<td>43</td>
</tr>
</tbody>
</table>

Before calculating the Bayes factor, the data in Table 2 are first to be checked if the two required conditions are satisfied before using the formula derived in the Appendix. Because \( \hat{p}_i = 0.952381 > \hat{p}_0 = 0.744186 \) and \( \hat{\sigma}_i = \sqrt{n_{i1}^{-1} \hat{p}_i \hat{q}_i} = 0.027 > \hat{\sigma}_0 = \sqrt{n_{01}^{-1} \hat{p}_0 \hat{q}_0} = 0.067 \), where \( n_{11} = 63 \), \( n_{00} = 43 \), the two required conditions are indeed being satisfied; hence it was free to use the formula in the Appendix. Let \( a_i = \hat{p}_i + 0.005 \) and \( b_i = \hat{q}_i + 0.005 \), \( i = 1,0 \), be substituted into Equations A17 to A11, it follows that

\[
\hat{M}_{[1,1,0,0]} = 1.1011, \quad M_{[1,0,1,0]} = 0.0828, \quad M_{[1,0,1,0]} = -0.0037, \quad \hat{M}_{[1,1,0,0]} = 0.0513, \quad M_{[1,0,1,0]} = 1.2369, \quad \hat{M}_{[1,0,1,0]} = 1.1169, \quad M_{[0,0,0,1]} = 0.6287, \quad M_{[0,0,0,1]} = -0.0567, \quad M_{[1,0,1,0]} = -0.0041, \quad M_{[0,0,1,1]} = 4.8652. \]

Then, substituting the above information into Equations A12 and A14, this leads to that \( N_0 = 0.1957 \), \( N_1 = 5.4652 \), \( N_2 = -31.4597 \), \( R_0 = 0.0016 \), \( R_1 = 0.1967 \), \( R_2 = -0.0041 \), \( R_3 = 0.0704 \), \( R_4 = 0.234 \), \( R_5 = -0.0252 \), \( R_6 = -0.1988 \), and \( a = 133.5876 \). Again, by substituting the above information into Equations A13 and A16, it follows that

\[
m_g^{(1)}(\eta, \tau) = \frac{-400.8(\eta + \tau)
\left\{ \eta \tau (\eta + \tau) \left[ 0.003\eta (\eta + \tau) - 0.002 \right]
+ 0.017\eta \tau (\eta + \tau) + 0.002\eta \right\} + 5.97\tau
}{2\sqrt{\eta + \tau}^2 (\eta + \tau)^3}
\]

and

\[
m_g^{(2)}(\eta, \tau) = \frac{2.33\eta \tau (\eta + \tau)^2 + 2.23(\eta + \tau) - 3.82}{2\left[ \sqrt{\eta + \tau} \left( \eta + \tau \right) \right]^3}
\]

Consequently, \( m_g(\eta, \tau) \) was readily obtained from substituting Equations 19 and 20 into Equation A17.
To find the relative maximum of \( \frac{m}{g}(\eta, \tau) \), the 2-dimensional unit square \([0,1] \times [0,1]\) was partitioned into 100 lattice points \((0.1, 0.1), (0.1, 0.2), \ldots, (1.0, 0.9), (1.0, 1.0)\) and then evaluated the function value of \( m \cdot g \) at these lattice points. After identifying the proximity of the relative maximum a finer neighborhood was then searched to locate it. Equation A17 was found to have a unique relative maxima: \( m_{\text{max}}(0.14, 1.0) = 2.15 \). The value of \( f(\bar{x}_{RD} | H_0) \) was evaluated directly from the probability density function of the central chi-square distribution with one degree of freedom; hence we have \( f(\bar{x}_{RD} | H_0) = 6.4 \times 10^{-6} \). After dividing the value of \( f(\bar{x}_{RD} | H_0) = 6.4 \times 10^{-6} \) by \( m_{\text{max}} = 2.15 \), we thus obtained the lower bound of the Bayes factor given by \( B^{\varepsilon}(\bar{x}_{RD}) = 3.0 \times 10^{-6} \).

Since \( \bar{x}_{RD} | H_0 = \hat{x}_{RD} = \hat{p}_D/\text{Var}(\hat{p}_D) = 19.1 \) \((p\text{-value} = 1.2 \times 10^{-5})\), where \( \hat{p}_D = \hat{p}_1 - \hat{p}_0 \), the null hypothesis \( H_0 \) was rejected for Table 2. Yet, the evidence from the lower bound of the Bayes factor \( B^{\varepsilon}(\bar{x}_{RD}) = 3.0 \times 10^{-6} \) was in favor of supporting \( H_1 \) (Equation 11) by at most a factor of “3.3 \times 10^5 to 1”. Hence the data in Table 2 are likely to be misclassified.

**Discussion**

Although both the \( p \)-value and the Bayes factor rejected the null hypothesis \( H_0 \) with respect to the data in Table 2, the \( p \)-value seemed much inclined to reject the null hypothesis \( H_0 \) in Equation 10 rather than that in Equation 11. In other words, the \( p \)-value is inadequate to reject the null hypothesis in Equation 11. This study provides another example to corroborate the \( p \)-value fallacy (Goodman 1999a, Goodman 1999b).

Because the Beta distribution which is the conjugate family of the binomial distribution was used as the prior distributions, the Bayes factor could of course change accordingly if other family of distributions is used as the prior distribution (Delampady & Berger, 1990).

The derivation of the formula provided in the Appendix was based on the two assumptions: (i) \( p_i > p_0 \), and (ii) \( \sigma_{\hat{p}_i} = \sqrt{n^{-1 \cdot p_i q_i}} < \sigma_{\hat{p}_0} = \sqrt{n^{-1 \cdot p_0 q_0}} \). These two assumptions can be verified if it is valid by substituting the crude prevalence estimator \( \hat{p}_i \) \((i = 0, 1)\) into the inequality. Should the both of the two assumptions fail to be satisfied, all we need to do is to switch the index accordingly for cases
and controls before using the formula provided in the Appendix. However, if only one of the assumptions is violated, Equation A4 has to be revised accordingly.

Appendix

By applying the quadratic approximation to the probability density function of the central chi-square distribution with one degree of freedom in Equation 17, we have

$$
\begin{align*}
f \left( \bar{x}_{RD} \mid \xi_{RD}, \varphi_0, \psi_0, \varphi_1, \psi_1 \right) &= \frac{1}{\sqrt{2\pi}} \bar{x}_{RD}^{-\frac{1}{2}} e^{-\frac{1}{2} \bar{x}_{RD}} \\
&\approx \frac{1}{\sqrt{2\pi}} \sqrt{\bar{x}_{RD}} \left( 1 - \frac{1}{2} \bar{x}_{RD} + \frac{1}{8} \bar{x}_{RD}^2 \right) \\
&= \frac{1}{\sqrt{2\pi}} \left[ \sqrt{\text{Var}(\bar{\xi}_{RD})} - \frac{1}{2} \frac{\bar{\xi}_{RD}}{\sqrt{\text{Var}(\bar{\xi}_{RD})}} + \frac{1}{8} \left( \frac{\bar{\xi}_{RD}}{\sqrt{\text{Var}(\bar{\xi}_{RD})}} \right)^3 \right],
\end{align*}
$$

(A1)

where $\bar{\xi}_{RD}$ and $\text{Var}(\bar{\xi}_{RD})$ are given by Equations 12 and 14, respectively.

By using the linear approximation:

$$
\left[ \left( 1 - \frac{1}{\xi_{RD}} (\bar{p}_1 - \bar{p}_0) \right) \right]^{-1} \approx 1 + \frac{1}{\xi_{RD}} (\bar{p}_1 - \bar{p}_0),
$$

it follows that
\[
\sqrt{\text{Var}(\hat{\epsilon}_{\text{RD}})} = \frac{\sqrt{\Delta_i^{-2} n_{[i]}^{-1} (p_i \Delta_i + 1 - \psi_i)(q_i \Delta_i + 1 - \phi_i)}}{\hat{p}_i - \hat{p}_0 - \epsilon_{\text{RD}}} + \frac{\sqrt{\Delta_0^{-2} n_{[0]}^{-1} (p_0 \Delta_0 + 1 - \psi_0)(q_0 \Delta_0 + 1 - \phi_0)}}{\hat{p}_0 - \hat{p}_0 - \epsilon_{\text{RD}}}
\]

\[
= \frac{\sqrt{1 + A^{-1}\left\{ \sum_{i=0}^{\infty} n_{[i]}^{-1} \Delta_i^{-1} \left[ (1 - p_i \phi_i - q_i \psi_i) + \Delta_i^{-1} \tilde{\phi}_i \tilde{\psi}_i \right] \right\}}}{\hat{p}_i - \hat{p}_0 - \epsilon_{\text{RD}}} - \frac{1 - \epsilon_{\text{RD}}^{-1} (\hat{p}_i - \hat{p}_0)}{1 - \epsilon_{\text{RD}}^{-1} (\hat{p}_0 - \hat{p}_0)}
\]

\[
\approx -I^{-1} \cdot \epsilon_{\text{RD}}^{-1} \cdot \frac{1}{\sqrt{1 + I^2 J} \left[ 1 + \epsilon_{\text{RD}}^{-1} (\hat{p}_i - \hat{p}_0) \right]} \left[ \frac{1}{I^2 J} \left[ 1 + \epsilon_{\text{RD}}^{-1} (\hat{p}_0 - \hat{p}_0) \right] \right]
\]

\[
= -I^{-1} \cdot \epsilon_{\text{RD}}^{-1} \left\{ 1 + \epsilon_{\text{RD}}^{-1} \left[ \Delta_i^{-1} u(\phi_i) - \Delta_0^{-1} u(\phi_0) \right] + \frac{1}{2} I^2 J \right\}
\]

where

\[ A = n_{[i]}^{-1} p_i q_i + n_{[0]}^{-1} p_0 q_0 \]

\[ I = A^{-\frac{1}{2}} \]

\[ J = \sum_{i=0}^{\infty} K_i \]

\[ K_i = n_{[i]}^{-1} \left[ \Delta_i^{-1} (1 - p_i \phi_i - q_i \psi_i) + \Delta_i^{-2} \tilde{\phi}_i \tilde{\psi}_i \right] = n_{[i]}^{-1} \left[ -q_i + \Delta_i^{-1} s(\phi_i) + \Delta_i^{-2} t(\phi_i) \right] \]

\[ s(\phi_i) = q_i (2 \phi_i - 1) \]

\[ t(\phi_i) = \phi_i (1 - \phi_i) \]

\[ u(\phi_i) = \hat{p}_i - \phi_i \]

By using the quadratic approximation on \( \epsilon_{\text{RD}}^{-1} \), \( I^{-1} \) and \( I \), we have by assuming that \( p_i > p_0 \) and \( n_{[i]}^{-1} p_i q_i < n_{[0]}^{-1} p_0 q_0 \).
\( \varepsilon_{RD}^{-1} \approx p_1^{-1} + p_0 p_1^{-2} + p_0^2 p_1^{-3} \)

\[
I^{-1} \approx \frac{1}{\sqrt{n_{[0]}}} \left[ \sqrt{p_0 q_0} + \frac{n_{[0]}}{n_{[1]}} \sqrt{p_0 q_0} - \frac{1}{8} \frac{n_{[0]}}{n_{[1]}} \left( \frac{p_i q_i}{p_0 q_0} \right)^2 \right]
\]

\[
I \equiv \frac{1}{\sqrt{A}} \approx \frac{1}{\sqrt{p_0 q_0}} \left[ 1 - \frac{1}{2} \frac{n_{[0]}}{n_{[1]}} p_i q_i + \frac{3}{8} \frac{n_{[0]}}{n_{[1]}} \left( \frac{p_i q_i}{p_0 q_0} \right)^2 \right]
\]

For fixed \( i = 0, 1 \) let

\[
M_{[i,j,k,l]} \equiv \int_a^b \left[ \frac{s^j(\varphi_i) t^k(\varphi_i) u^l(\varphi_i)}{\Delta_i^{j+k+l}} d\psi_i d\varphi_i \right] d\varphi_i \tag{A4}
\]

where \( a_i = \hat{p}_i + 0.005 \), \( b_i = \hat{q}_i + 0.005 \), \( s(\varphi_i) \), \( t(\varphi_i) \) and \( u(\varphi_i) \) are all defined in Equation A3. Let us calculate some of Equation A5 which will be needed later. For \( j = 1, k = l = 0 \) we have

\[
M_{[1,1,0,0]} \equiv \int_a^b \int_c^d \left[ \frac{s(\varphi)}{\Delta_i} \right] d\psi_i d\varphi_i = \int_a^b \left[ s(\varphi) \left[ \ln \varphi_i - \ln \varphi_i - \overline{\varphi}_i \right] \right] d\varphi_i
\]

\[
= \int_a^b \left[ \left( s'(0) \varphi_i + s(0) \right) \ln \varphi_i - \left[ s'(\overline{\varphi}_i) \left( \varphi_i - \overline{\varphi}_i \right) \right] \right] d\varphi_i
\]

\[
= q_i \dot{M}_{[1,1,0,0]}
\]

where \( \delta_i = a_i + b_i - 1 \), \( \overline{\varphi}_i = 1 - b_i \), and

\[
\dot{M}_{[1,1,0,0]} \equiv \delta_i^2 \ln \delta_i - a_i^2 \ln a_i - b_i^2 \ln b_i + a_i \ln a_i
\]

\[
+ \left( 2 \overline{\varphi}_i - 1 \right) \left( \delta_i \ln b_i + b_i - \overline{\varphi}_i \right) + \frac{1}{2} \left( 1 + a_i^2 + b_i^2 - \delta_i^2 \right)
\]

For \( j = l = 0, k = 1 \) we have
BAYES FACTOR FOR CASE-CONTROL STUDIES MISCLASSIFIED DATA

\[ M_{[1,0,1,0]} = \frac{1}{\Delta_i} \int \int [t(\varphi_i) / \Delta_i^2 \, d\varphi_i \, d\varphi_i] \]

\[ = \int_{\alpha_i} \left[ \frac{1}{2} \varphi_i^2 (\varphi_i - \bar{\varphi}_i)^2 + t(\varphi_i) \varphi_i - \bar{\varphi}_i \right] \, d\varphi_i \]

\[ = \sum_{m=1}^{3} \left( d_{m[1,0,1,0]} + e_{m[1,0,1,0]} \right) = b_i \bar{b}_i \ln (b_i / \delta_i) \]  

where \( \bar{a}_i = 1 - a_i \), and

\[ d_{[0,1,0,0]} = -\frac{1}{2} \bar{a}_i (b_i + \delta_i), d_{[2,1,0,0]} = \bar{a}_i (1 - 2\bar{b}_i), d_{[3,1,0,0]} = b_i \bar{b}_i \ln (b_i / \delta_i), \]

\[ e_{[0,1,0,0]} = \frac{1}{2} \bar{a}_i (1 + a_i), e_{[1,0,1,0]} = -\bar{a}_i, e_{[3,0,1,0]} = 0 . \]

For \( j = k = 0, l = 1 \) we have

\[ M_{[1,0,0,1]} = \frac{1}{\Delta_j} \int \int u(\varphi_i) \, d\varphi_i \, d\varphi_i \]

\[ = -\hat{\rho}_i \varphi_i \ln a_i + (\hat{\varphi}_i - b_i)(b_i \ln b_i - \delta_i \ln \delta_i) \]

\[ + \frac{1}{2} \left( a_i^2 \ln a_i + b_i^2 \ln b_i - \delta_i^2 \ln \delta_i \right) \]

\[ - \frac{1}{4} \left( a_i^2 + b_i^2 - \delta_i^2 - 1 \right) - \bar{a}_i \bar{b}_i \]  

For \( j = l = 1, k = 0 \) we have
\[ M_{[i,1,0,1]} = \int_{a_i}^{b_i} \frac{s(\varphi_i) \cdot u(\varphi_i)}{\Delta_i} d\psi_i d\varphi_i \]

\[ = \sum_{m=1}^{3} \left( d_{m[i,1,0,1]} + e_{m[i,1,0,1]} \right) = q_i \tilde{M}_{[i,1,0,1]} \]

where

\[ v_i(\varphi_i) = s(\varphi_i) u(\varphi_i) = q_i (2 \varphi_i - 1) (\hat{p}_i - \varphi_i), \]

\[ d_{i[i,1,0,1]} = -q_i \tilde{a}_i (\tilde{b}_i + \delta_i), d_{2[i,1,0,1]} = q_i \tilde{a}_i \left[ 1 + 2(\hat{p}_i - \tilde{b}_i) \right], \]

\[ d_{3[i,1,0,1]} = q_i \tilde{b}_i \left[ 1 + 2(\hat{p}_i - \tilde{b}_i) - \hat{p}_i \right] \ln(b_i/\delta_i), \]

\[ e_{i[i,1,0,1]} = q_i \tilde{a}_i (1 + \tilde{a}_i), e_{2[i,1,0,1]} = -q_i (1 + 2 \hat{p}_i) \tilde{a}_i, e_{3[i,1,0,1]} = \hat{p}_i q_i \ln a_i, \]

\[ \tilde{M}_{[i,1,0,1]} \equiv \tilde{b}_i \left[ (1 + \hat{p}_i - 2\tilde{b}_i) \ln(b_i/\delta_i) + \hat{p}_i \ln a_i \right] \]

For \( j = 0, k = l = 1 \) we have
BAYES FACTOR FOR CASE-CONTROL STUDIES MISCLASSIFIED DATA

\[ M_{[\omega,0,1,\lambda]} = \int_{a_i}^{b_i} \frac{t(\varphi_i) \cdot u(\varphi_i)}{\Delta_i^2} d\varphi_i d\varphi_i \]

\[ = \frac{1}{2} \int_{a_i}^{b_i} \left[ \frac{\frac{1}{2} v_2''(b_i)(\varphi_i - \bar{\beta}_i)^3 + \frac{1}{2} v_2''(b_i)(\varphi_i - \bar{\beta}_i)^2}{(\varphi_i + b_i)^2} \right] \]

\[ + \left[ \frac{1}{2} v_2'(b_i)(\varphi_i - \bar{\beta}_i) + v_2(b_i) \left( \varphi_i + (\bar{\beta}_i)^2 \right) \right] d\varphi_i \]

\[ = \sum_{m=1}^{4} \left( d_{m[\omega,0,1,\lambda]} + e_{m[\omega,0,1,\lambda]} \right) \]

\[ = 2\alpha \bar{b}_i + \frac{1}{2} \left[ \left[ 3\bar{b}_i^2 - 2(1 + \hat{p}_i)\bar{b}_i + \hat{p}_i \right] \ln \left( \frac{b_i}{\delta_i} \right) \right] \]

\[ + b_i a_i \left( \hat{p}_i - \bar{\beta}_i \right) \left( b_i + \delta_i \right) \left( b_i + \delta_i \right)^2 \]

where

\[ v_2(\varphi_i) = t(\varphi_i)u(\varphi_i) = \varphi(1 - \varphi_i)(\hat{p}_i - \varphi_i), \]

\[ d_{1[\omega,0,1,\lambda]} = \frac{1}{2} a_i (b_i + \delta_i), \]

\[ d_{2[\omega,0,1,\lambda]} = \frac{1}{2} a_i \left[ 3\bar{b}_i^2 - (1 + \hat{p}_i) \right], \]

\[ d_{3[\omega,0,1,\lambda]} = \frac{1}{2} \left[ 3\bar{b}_i^2 - 2(1 + \hat{p}_i)\bar{b}_i + \hat{p}_i \right] \ln \left( \frac{b_i}{\delta_i} \right), \]

\[ d_{4[\omega,0,1,\lambda]} = \frac{1}{2} b_i \left( \hat{p}_i - \bar{\beta}_i \right) a_i \left( b_i + \delta_i \right) \left( b_i + \delta_i \right)^2, \]

\[ e_{1[\omega,0,1,\lambda]} = -\frac{1}{2} a_i (1 + \omega), \]

\[ e_{2[\omega,0,1,\lambda]} = \frac{1}{2} (1 + \hat{p}_i) a_i, \]

\[ e_{3[\omega,0,1,\lambda]} = \frac{1}{2} \hat{p}_i \ln a_i, \]

\[ e_{4[\omega,0,1,\lambda]} = 0. \]

Note that in all of the above calculations I first integrate with respect to \( \psi_i \) and then integrate with respect to \( \varphi_i \) by employing the Taylor’s series expansion to expand the function about \( \varphi_i = \bar{\beta}_i \) or 0.

Now we are ready to calculate the marginal probability density function of Equation A1 one by one.
\[
\int \int \int \frac{\text{Var}(\hat{\varepsilon}_{RD})}{\hat{\varepsilon}_{RD}} \prod_{i=0}^{1} d\psi_i d\varphi_i = - \left\{ I^{-1} \varepsilon_{RD}^{-1} \delta_i^{-1} + I^{-1} \varepsilon_{RD}^{-2} \left( \alpha_i \tilde{M}_0 [1,0,0,1] - \alpha_i \tilde{b}_1 M_{[0,0,0,1]} \right) \right. \\
\left. + \frac{1}{2} I \varepsilon_{RD}^{-1} \sum_{i=0}^{1} n_{i}^{-1} \left[ -\delta_i^{-1} q_i - \frac{n_{i}^{-1}}{2} \left( q_i \tilde{M}_0 [1,0,0,1] - \alpha_i \tilde{b}_1 M_{[0,0,0,1]} \right) \right] \right. \\
+ \left. \frac{1}{2} I \varepsilon_{RD}^{-2} \left[ -q_1 \alpha_1 \tilde{b}_0 M_{[1,0,0,1]} + \alpha_0 \tilde{b}_0 \left( q_i \tilde{M}_0 [1,0,0,1] + M_{[0,0,0,3]} \right) \right] \right. \\
\left. \left. + \frac{1}{2} I \varepsilon_{RD}^{-2} \left[ n_{i}^{-1} \left( q_i \tilde{R}_1 + \alpha_i \tilde{b}_0 M_{[1,0,0,0]} \right) \right] \right. \\
\left. \left. + \frac{1}{2} I \varepsilon_{RD}^{-2} \left[ n_{i}^{-1} \left( q_i \tilde{R}_2 + \alpha_i \tilde{b}_0 M_{[0,0,0,0]} \right) \right] \right. \\
\left. \left. + \frac{1}{2} I \varepsilon_{RD}^{-2} \left[ n_{i}^{-1} \left( q_i \tilde{R}_3 + \tilde{R}_4 \right) \right] \right. \right. \\
\left( A11 \right) \\
\right.
\]

where

\[
R_0 = \alpha_0 \tilde{b}_0 M_{[1,0,0,1]} - \alpha_1 \tilde{b}_1 M_{[0,0,0,1]}, \quad R_1 = \alpha_0 \tilde{b}_0 M_{[1,1,0,0]} - \varphi^{-1}, \quad R_2 = \alpha_1 \tilde{b}_1 M_{[1,0,1,0]} - \varphi^{-1},
\]

\[
R_3 = M_{[0,0,0,1]} \left( \alpha_1 \tilde{b}_1 - \tilde{M}_{[1,1,0,0]} \right) + \alpha_0 \tilde{b}_0 \left( \tilde{M}_{[1,1,0,1]} - M_{[1,0,0,1]} \right),
\]

\[
R_4 = \alpha_1 \tilde{b}_1 M_{[1,0,1,1]} - M_{[0,0,0,1]} M_{[1,0,1,0]},
\]

\[
R_5 = M_{[1,0,0,1]} \left( \tilde{M}_{[1,0,0,0]} - \alpha_0 \tilde{b}_0 \right) + \alpha_1 \tilde{b}_1 \left( M_{[0,0,0,1]} - \tilde{M}_{[0,1,0,0]} \right),
\]

\[
R_6 = M_{[1,0,1,0]} M_{[0,0,0,1]} - \alpha_1 \tilde{b}_1 M_{[0,0,1,1]}
\]

⇒

BAYES FACTOR FOR CASE-CONTROL STUDIES MISCLASSIFIED DATA

\[ m_{g}^{(1)} = \omega \zeta \left( \int_{\vec{\xi}_{Rd}} \sqrt{\text{Var}(\vec{\xi}_{Rd})} \prod_{i=0}^{1} p_{i} q_{i} \, dp_{i} dq_{i} d\psi_{i} d\varphi_{i} \right) \]

\[ = -\zeta \left[ \frac{3N_{0} \tau^{1}}{\sqrt{\eta \tau}} + \left( 9N_{0} R_{0} \tau + \frac{3}{2} N_{1} \left( n_{1}^{-1} R_{1} \tau + \tilde{a}_{0} \tilde{b}_{0} M_{[0,1,0,1,0]} \right) \right) \right] \left( \eta + \tau \right) \sqrt{\frac{1}{\eta \tau}} \]

\[ = -\frac{3\zeta (\eta + \tau)}{2\sqrt{\eta \tau} \eta^{2} (\eta + \tau)^{3}} \tau \left( n_{1}^{-1} R_{3} + n_{0}^{-1} R_{5} \right) - 9N_{1} \zeta \tau \left( n_{1}^{-1} R_{0} + n_{0}^{-1} R_{0} \right) \]

(A13)

where for \( i, j, k, l = 0, 1 \) \( M_{[i,j,k,l]} \) and \( \hat{M}_{[i,j,k,l]} \) are given respectively by Equations A6-A10,

\[ \omega = \left[ \Gamma(\eta + \tau) / \left( \Gamma(\eta) \Gamma(\tau) \right) \right]^{2}, \]

\[ \zeta = \left( \tilde{a}_{0} \tilde{b}_{0} \tilde{a}_{0} \tilde{b}_{0} \right)^{-1}, \tilde{a}_{i} = 1 - a_{i}, \tilde{b}_{i} = 1 - b_{i} \]  \hspace{1cm} (A14)

\[ N_{0} = n_{0}^{-\frac{1}{2}} \left( 1 + \frac{1}{2} n_{0}^{-1} n_{0} \right), \]

\[ N_{1} = n_{1}^{-\frac{1}{2}} \left( 1 - \frac{1}{2} n_{0}^{-1} n_{1} + \frac{1}{2} n_{0}^{-1} n_{1} \right) \]

On the other hand, by integrating the following equation with respect to \( \varphi_{i}, \psi_{i}, i = 0, 1 \)
\[
\frac{\bar{\varepsilon}_{RD}}{\sqrt{\text{Var}(\varepsilon_{RD})}} = \frac{\bar{p}_i - \bar{p}_0 - \varepsilon_{RD}}{\sqrt{A}} \left( 1 - \frac{J}{2A} \right) \\
= I \left( \frac{u(\varphi_1)}{\Delta_1} - \frac{u(\varphi_0)}{\Delta_0} - \varepsilon_{RD} \right) - \frac{1}{2} I^3 \left( \frac{u(\varphi_1)}{\Delta_1} - \frac{u(\varphi_0)}{\Delta_0} - \varepsilon_{RD} \right) J
\]

This leads to

\[
\int \int \int \frac{\bar{\varepsilon}_{RD}}{\sqrt{\text{Var}(\varepsilon_{RD})}} \prod_{i=0}^{1} d\psi_i d\varphi_i = I \left( R_0 - \varepsilon^{-1} \varepsilon_{RD} \right)
\]

Further, we obtain by integrating Equation A15 with respect to \( p_i, q_i, i = 0, 1 \)

\[
m^{(2)}_g \equiv \omega \zeta \int_{\Omega \times \mathcal{R}} \frac{\bar{\varepsilon}_{RD}}{\sqrt{\text{Var}(\varepsilon_{RD})}} \prod_{i=0}^{1} p_i^{q-1} q_i^{r-1} dp_i dq_i d\psi_i d\varphi_i
\]

\[
= \zeta \left\{ \frac{N_1 R_0}{(\eta + \tau)^2 \sqrt{\eta \tau}} - \frac{1}{2} \left[ \frac{N_2 \left( n_{[1]}^{-1} R_3 + n_{[0]}^{-1} R_5 \right)}{\eta (\eta + \tau)^3 \sqrt{\eta \tau}} + \frac{N_2 \left( n_{[1]}^{-1} R_4 + n_{[0]}^{-1} R_6 \right)}{\eta \tau (\eta + \tau)^3 \sqrt{\eta \tau}} \right] \right\}
\]

(A16)

where \( \zeta, N_1, R_0, \) and \( R_j, j = 3, 4, 5, 6 \) are given respectively by Equations A12 and A14, and

\[
N_2 \equiv \sqrt{n_{[0]}^3} \left( 1 - \frac{3n_{[0]}^3}{2n_{[1]^3}} - \frac{3n_{[0]}^3}{8n_{[1]^3}} + \frac{45n_{[0]}^4}{64n_{[1]^3}} - \frac{27n_{[0]}^5}{128n_{[1]^3}} + \frac{27n_{[0]}^6}{512n_{[1]^3}} \right)
\]
Note that in calculating Equations A13 and A16 I used an approximation on the Gamma function: \( \Gamma(z+a)/\Gamma(z+b) \approx z^{a-b} \) (Askey & Roy, 2010).

By integrating Equation 12 with respect to \((\varphi_i,\psi_i)\) first and then \((p_i,q_i)\) for \(i = 0, 1\) we obtain \(m_g(\eta, \tau)\) by substituting Equations A13 and A16 into Equation A17:

\[
m_g(\eta, \tau) = (2\pi)^{-\frac{1}{4}} \left\{ m_g^{(1)}(\eta, \tau) - \frac{1}{2} m_g^{(2)}(\eta, \tau) + \frac{1}{8} \left[ m_g^{(2)}(\eta, \tau) \right]^3 \right\} \quad (A17)
\]
